

a Different histories at reunion

Earlier direct opportunity

Prescribed motion
Now: posterior exchange

Packet arrival does not reset
local direct-opportunity age

b Qualify each label

A Older observed belief

$$h_A = 1, \quad \Delta_A > 0$$

High r_A

B Recent missed detection

$$h_B = 1, \quad \Delta_B = 0$$

Low r_B

U Untouched prior

$$h_U = 0$$

Excluded here: informed inputs exist

$\times$

h : observation lineage

Δ : local direct-opportunity age

Observable absence enters $\mathcal{E}$ only

c Two weights, one fused belief

Existence: apply direct age

$$q_j \propto w_j f(\Delta_j), \quad j \in \mathcal{E}$$

$$\text{logit } r^* = \sum_j q_j \text{logit } r_j + \log \eta_a$$

Recent detections and misses both count

Spatial overlap η_a

Spatial density: retain base weights

$$a_j \propto w_j, \quad j \in \mathcal{P}$$

$$p^*(x) = \eta_a^{-1} \prod_j p_j(x)^{a_j}$$

Same eligible inputs and spatial weights

Fixed inputs: spatial pooling stays unchanged
